## Motivation

- Nothing new: material here goes back 20-30 years.
- There are two classic cookbook

Dynamic Programming Speedups in the literature:
Knuth-Yao technique \& SMAWK algorithm.

- They "feel" similar. Are they related?
- Knuth-Yao predates online algorithms.

Can the KY speedup be maintained online?

- Answers to the two questions turned out to be related.
- Note: major confusion arises in the analysis because certain essential terms, e.g., quadrangle-inequality, monotone and online-algorithm have been used in very different ways in the two techniques' literature.

## Outline

- Background
- Knuth-Yao (KY) Quadrangle Inequality (QI) Speedup
- SMAWK Algorithm for finding

Row Minima of Totally Monotone (TM) Matrices

- The $D^{d}$ Decomposition

A transformation from QI to TM such that
SMAWK solves KY problem as quickly as KY.

- The $L^{m}$ and $R^{m}$ Decompositions

Another transformation from QI to TM that
(1) implies KY speedup and (2) enables online solution.

- Extensions

Applying the technique to known generalizations of KY.

## Outline

- Background
- Knuth-Yao (KY) Quadrangle Inequality (QI) Speedup
- SMAWK Algorithm for finding

Row Minima of Totally Monotone (TM) Matrices

- The $D^{d}$ Decomposition

A transformation from Ql to TM such that
SMAWK solves KY problem as quickly as KY.

- The $L^{m}$ and $R^{m}$ Decompositions Another transformation from QI to TM that (1) implies KY speedup and (2) enables online solution.
- Extensions Applying the technique to known generalizations of KY.

- If $M$ is Totally Monotone, all $m$ row minima can be found in $O(m+n)$ time.
- Usually $m=\Theta(n)$
$\Theta(n)$ speedup: $O\left(n^{2}\right)$ down to $O(n)$.

## SMAWK Algorithm

- Motivation

Find all $m$ row minima of an implicitly given $m \times n$ matrix $M$

- Naive Algorithm: $O(m n)$
- SMAWK Algorithm
[Aggarwal, Klawe, Moran, Shor, Wilber (1986)]
- If $M$ is Totally Monotone, all $m$ row minima can be found in $O(m+n)$ time.
- Usually $m=\Theta(n)$
$\Theta(n)$ speedup: $O\left(n^{2}\right)$ down to $O(n)$.
- SMAWK was culmination of decade(s) of work on similar problems; speedups using convexity and concavity.

## Outline

- Background
- Knuth-Yao (KY) Quadrangle Inequality (QI) Speedup
- SMAWK Algorithm for finding

Row Minima of Totally Monotone (TM) Matrices

- The $D^{d}$ Decomposition

A transformation from Ql to TM such that SMAWK solves KY problem as quickly as KY.

- The $L^{m}$ and $R^{m}$ Decompositions

Another transformation from QI to TM that
(1) implies KY speedup and (2) enables online solution.

- Extensions

Applying the technique to known generalizations of KY.

$$

## $R^{m}$ is Monge

Definition $\quad R_{i, j}^{m}=w(i, m)+\left\{B_{i, j-1}+B_{j, m}\right\}$
By definition

$$
\begin{aligned}
R_{i, j}^{m}+R_{i+1, j+1}^{m}= & \{w(i, m)+w(i+1, m)\}+ \\
& \left\{B_{i, j-1}+B_{i+1, j}\right\}+\left\{B_{j, m}+B_{j+1, m}\right\} \\

& \left\{B_{i+1, j-1}+B_{i, j}\right\}+\left\{B_{j, m}+B_{j+1, m}\right\}
\end{aligned}
$$

Since $B$ satisfies Q ,

$$
B_{i, j-1}+B_{i+1, j} \leq B_{i+1, j-1}+B_{i, j}
$$

Goal

$$
R_{i, j}^{m}+R_{i+1, j+1}^{m} \leq R_{i+1, j}^{m}+R_{i, j+1}^{m}
$$

## $R^{m}$ is Monge

Definition $\quad R_{i, j}^{m}=w(i, m)+\left\{B_{i, j-1}+B_{j, m}\right\}$

## By definition

$$
\begin{aligned}

$$

Since $B$ satisfies QI,

$$
B_{i, j-1}+B_{i+1, j} \leq B_{i+1, j-1}+B_{i, j}
$$

So

$$
R_{i, j}^{m}+R_{i+1, j+1}^{m} \leq R_{i+1, j}^{m}+R_{i, j+1}^{m}

## Note

Aggarwall and Park (FOCS '88) developed a 3-D monotone matrix representation of the $K-Y$ problem and then showed how to use an algorithm due to Wilber (for online computation of maxima of certain concave sequences) to calculate "tube-maxima" of their matrices.

Careful decomposition of their work yields a decomposition similar to $L^{m}$ and an $O(n)$ algorithm for calculating its row-minima. This provides an alternative derivation of the previous result (with a symmetry argument extending it to $R^{m}$ )

- $B_{i, j}=w(i, j)+\min _{i<t \leq j}\left\{B_{i, t-1}+B_{t, j}\right\}$
- $w(i, j)$ satisfies Ql, if $\forall i \leq i^{\prime} \leq j \leq j^{\prime}$

$$
w(i, j)+w\left(i^{\prime}, j^{\prime}\right) \leq w\left(i^{\prime}, j\right)+w\left(i, j^{\prime}\right)
$$

- Borchers and Gupta
- $B_{i, j}=\min _{i<t \leq j}\left\{w(i, t, j)+a B_{i, t-1}+b B_{t, j}\right\}$

- $w(i, t, j)$ satisfies generalized QI and MIL.

## Outline

- Background
- Knuth-Yao (KY) Quadrangle Inequality (QI) Speedup
- SMAWK Algorithm for finding

Row Minima of Totally Monotone (TM) Matrices

- The $D^{d}$ Decomposition

A transformation from QI to TM such that
SMAWK solves KY problem as quickly as KY.

- The $L^{m}$ and $R^{m}$ Decompositions

Another transformation from QI to TM that
(1) implies KY speedup and (2) enables online solution.

- Extensions

Applying the technique to known generalizations of KY.
